Hi,
This is our Marvell AC5 based L2+ switch featuring
1. 24 Port PoE af/at for multiple PDs
2. 10G Fiber Uplinks help smooth traffic transport
3. Support OEM and customizable Web GUI
**Price: 180USD/PC**
Do you need some samples for testing?
Thank you.

This actually does have my interest.

What levels of customization are offered? I would be interested if there was api availability for controller integration.

If you have some specification sheets and models available I would love to see them.

Thank you

Hi Christopher,
Thank you for your reply.

1. Customization

We support a wide range of OEM/ODM customization options, including:
Company logo / Packaging / Front panel (PVC mask) / Product label / Model name / Serial number

/ User manual / Default login IP / SNMP OID customization / Web GUI language
These are all mature customization options that we already support.
We can also discuss firmware customization for specific project requirements, subject to technical evaluation.

2. Controller Integration / API

To better understand your requirements, could you share a little more about your controller architecture?
For example, are you referring to:
. REST API
. SNMP-based management
. SSH/CLI automation
. NETCONF
. Another controller platform or integration method
The more we understand your intended use case, the better we can evaluate the most suitable solution with our engineering team.

3. Technical Documents

For now, I'd like to share our product information for your initial review, including:
. Datasheet
. Web Management Manual
. Feature List
. MIB Manual
Once you've had a chance to review them, we can discuss the controller integration requirements in more detail.

4. Your Approach

I noticed the phrase "It's about function, not vendors" on your website.
That philosophy is actually very close to how we approach our products.
We focus on engineering, long-term supply, and practical deployment rather than marketing-driven specifications.
And are you mainly evaluating switches for:
. Your consulting lab
. Customer deployments
. Or private-label (OEM) opportunities?

Looking forward to your thoughts.
Thank you.
